AN Introduction to Structured Program Design in COBOL

COBOL : COmmon Business Oriented Language .

Hardware : Any part of a computer system that you can see or touch, such as a keyboard, Screen, Mouse, Joystick, Printer, Speakers... etc.

Software : electronic instructions that tells your computer what to do. (without the software a computer is like an airplane without a pilot)

Program : Set of instructions that enable a computer to process data.

2 types of computer programs:

- 1. **Operating system programs**: control the overall operations of the computer. (ex. DOS, Windows).
- 2. **Application programs**: Perform tasks required by users. (ex. Word, COBOL, Games).

Application Program : Operates on input data and convert it to meaningful output information.

Application program is written by a programmer to provide the users with the information they need.

2 type of applications

- 1. One time problem solution. (Ex. Program to display an average of set of exams)
- 2. Application runs periodically or in a regular basis. (Ex. Program to print student's transcripts)

Information systems: A set of computerized business procedures in an application area.

Customized Program: program is written for specific user.

Machine Language Programs:

All programs to be executed by the computer must be in a machine language. Since machine language is so difficult, programming languages were developed to enable the programmer to write English-like or symbolic instructions.

Symbolic Programming Languages:

that can be translated or **compiled** into machine language. Such as COBOL, Pascal, Basic, C or C++.

Compiler : translator program that translates (converts)symbolic languages into machine languages.

• COBOL is extensively for commercial applications.

The Applications Program Development Process:

Programmers who begin with the coding phase often produce poorly designed or inadequate programs.

The following is an overview of the steps involved in program development process.

- 1. Obtaining Program specifications: getting the system input/output specification for a program.
- 2. Design Using Program Planning Tools: Design using the following tools
 - Flowcharts
 - Pseudocode
 - Hierarchy charts
- 3. Code The Program: Write the program source code. (COBOL CODE)
- 4. Compiling and Testing the program: Make sure that the program has <u>NO</u> Syntax or Logic Errors.
- 5. Documenting the program: write the procedure manual. It is form people who will be working with the output and the operators who will run the program on regularly scheduled basis

The Nature of COBOL:

• COBOL is Business Oriented Language :

Used to develop business applications such as payroll, inventory. They typically operate on large volume of data. They not suitable for scientific applications where complex calculations are required.

• COBOL is a standard Language:

COBOL program may be compiled and runs on a variety of different machines with COBOL compiler of that machine and minor modifications. Because the language is so widely used, the computers of the next generation will support COBOL.

• COBOL is English-Like Language:

Basically, Cobol has 2 advantages:

- 1. Common to most computers.
- 2. It is business oriented.

The third advantage is that All instructions can be coded using English words rather than complex codes. (ex. The word Add is used to add 2

numbers.)

• COBOL is User-Friendly Language:

Because users are frequently able to understand the English-Like instructions of COBOL, it is considered a user-friendly language. It is not overly technical like other languages such as C/C++.

A History of COBOL and the ANS Versions:

Techniques for Improving Program Design

1) <u>Structured Programming Using Modular Design for Coding</u> <u>Paragraph.</u>

This technique uses logical control constructs that makes the program easier to read, debug, and modify. (Reduce the number of GO TOs in the program) (It is called the GO-TO-Less Programming. Sequence is controlled by the PERFORM Statement. (Same as WHILE ... DO, in PASCAL). Each section of the program is written independently and debugged separately.

A typical structured program is subdivided into paragraphs or **MODULES** where the main module calls in the other modules as needed. Each module can be tested independently.

Modules can be written by different people and the main module calls those modules.

2) <u>A Top-Down Approach for Coding Modules.</u>

Develop the major modules before going the minor ones. Example is the same as writing a term paper. One starts with the outline then takes each point in the outline and expands it.

A Sample Program

An Overview of the four Divisions of the any COBOL Program

Name	Purpose				
IDENTIFICATION DIVISION	Identifies the program to the computer. It also				
	provides some documentation about the program				
ENVIRONMENT DIVISION	Describes the specific computer equipment that will				
	be used by the program				
DATA DIVISION	Describes the input and the output formats to be				
	used by the program. It also defines any constants				
	and work areas necessary for the processing of				
	data.				
PROCEDURE DIVISION	Contains the instructions necessary for reading				
	input, processing it, and creating the output				

The IDENTIFICATION and ENVIRONMENT DIVISIONS.

<u>The Identification Division</u> has ONE required entry. The required entry is Program-ID. This to serve as a name of the program. Their are other optional entries such as Author, Date Written, and Date Compiled.

Syntax is

Identification Division. Program –ID. Sample. Author. Husain Gholoom Date-Written. 03/07/2009. Date-Compiled. 03/07/2009.

The Environment Division.

The Environment Division <u>assigns</u> the input and the output <u>files</u> to specific devices in the e INPUT-OUTPUT Section.

Syntax is

Environment Division. Input-Output Section. File-Control. Select InputFilename Select OutputFileName Assign To Disk. Assign To Sysoutput.

The Data Division.

The FILE Section of the Data Division <u>describes</u> the format of the input and the output files. Thee data division has e Sections: The File-Section and the Working-Storage Section.

1) File Section: The <u>FD</u> (*File Description*) Describes the Input and the output files. Each file has a label. Within each file, there is a <u>record</u> description. Each record contains filed names, their types, and their sizes.

2) The **Working-Storage Section**. This section is used to define any field that is not part of the input or the output record.

Syntax is

File Section. FD InputFileName. Label Records are standard. 01 input Record. 05 Filed1 PICTURE X(5). 05 Filed2 PICTURE 9(5). 05 Field3 PICTURE 99v999.	Data Div	sion.
01 input Record. 05 Filed1 PICTURE X(5). 05 Filed2 PICTURE 9(5). 05 Field3 PICTURE 99v999. FD OutputFileName. Label Records are Omitted. 01 OutputRecord. 05 OutputFiled1 PICTURE X(5). 05 OutputFiled2 PICTURE 9(5).	File Secti	on.
05 Filed1 PICTURE X(5). 05 Filed2 PICTURE 9(5). 05 Field3 PICTURE 99v999. FD OutputFileName. Label Records are Omitted. 01 OutputFiled1 PICTURE X(5). 05 OutputFiled2 PICTURE 9(5).	FD Inpi	FileName. Label Records are standard.
05 Filed2 PICTURE 9(5). 05 Field3 PICTURE 99v999. FD OutputFileName. Label Records are Omitted. 01 OutputRecord. 05 OutputFiled1 PICTURE X(5). 05 OutputFiled2 PICTURE 9(5).	01 input	Record.
05 Field3 PICTURE 99v999. FD OutputFileName. Label Records are Omitted. 01 OutputRecord. 05 OutputFiled1 PICTURE X(5). 05 OutputFiled2 PICTURE 9(5).	$0\dot{5}$ F	led1 PICTURE X(5).
05 Field3 PICTURE 99v999. FD OutputFileName. Label Records are Omitted. 01 OutputRecord. 05 OutputFiled1 PICTURE X(5). 05 OutputFiled2 PICTURE 9(5).	05	
01 OutputRecord. 05 OutputFiled1 PICTURE X(5). 05 OutputFiled2 PICTURE 9(5).	05	
01 OutputRecord. 05 OutputFiled1 PICTURE X(5). 05 OutputFiled2 PICTURE 9(5).		
01 OutputRecord. 05 OutputFiled1 PICTURE X(5). 05 OutputFiled2 PICTURE 9(5).		
01 OutputRecord. 05 OutputFiled1 PICTURE X(5). 05 OutputFiled2 PICTURE 9(5).		
01 OutputRecord. 05 OutputFiled1 PICTURE X(5). 05 OutputFiled2 PICTURE 9(5).	FD Out	utFileName. Label Records are Omitted.
05 OutputFiled1 PICTURE X(5). 05 OutputFiled2 PICTURE 9(5).	-	
05 Output <i>Filed2</i> PICTURE 9(5).		
		•
		•
Working-Storage Section.	Working.	Storage Section
01 ARE-THERE –MORE-RECORDS PIC XXX Value 'YES'.	0	5

The Procedure Division.

The Procedure Division contains the set of instructions to be executed by the computer. Each instruction is executed in the order in which it appears in the coding sheet. First, a file must be opened, Then records are read, and operations are performed on each record. When all records are completed, the input and the output files must be closed and the program is terminated by a stop run command. Syntax is

 Procedure Division

 Open
 Input
 InputFileName

 Output
 OutputFileName.

 Read
 InputFileName
 At
 End
 XXXXXXXXXXX

 Perform
 Paragraph-A.
 Close
 InputFileName
 OutputFileName.

 Stop Run.
 Stop Run.
 Stop Run.
 Stop Run.

Example

....

.

A computer center of a large company is assigned the task of calculating weekly wages or gross pay for all nonsalaried personal. The employee name, hourly rate, and number of hours worked are supplied as an input for each employee, and the weekly wages figure is to be computed as follows:

WEEKLY-WAGES = HOURS-WORKED X HOULY -RATE.

Input Layout

Employee		Hours Worked in		Hourly		Rate	
Nama		A XX7 - 1-					
Name		A Week		Dollars	ars Cents		
1	20	21	22	23	24	25	
<u>Output Layout</u>							
XXXXXXXXXXXX		99	9.9	9 999.99		9	
(Name Out)		Hours-Out	Rate	Out		Weekly	Wage
